Internet Control Message Protocol
```

- 5. The <u>Identification</u>, <u>Time to Live</u>, and <u>Header Checksum</u> fields in the IP datagram always change from one datagram to the next within this series of ICMP message sent by my computer.
- 6. Fields that **Stay Constant**:
 - Version
 - Header Length
 - Differentiated Services Field
 - Total Length
 - Flags
 - Fragment Offset
 - Protocol
 - Source
 - Destination
 - Source GeoIP
 - Destination GeoIP

Fields that Must Stay Constant:

- Version [IPv4 used for all packets]
- Header Length [*All ICMP packets*]
- Differentiated Services Field [Same type of service being used]
- Total Length [Similar payload]
- Flags [All Stated Not Set]
- Protocol [All ICMP packets]
- Source [*All sent from my computer*]
- Destination [All sent to the same destination]
- Source GeoIP [Stated Unknown]
- Destination GeoIP [Stated Unknown]

Fields that Must Change:

- Identification [Each packet have their own IDs]
- Time to Live [traceroute increments with each packet] ✓
- Header Checksum [Along with header changes]
- 7. The last two spaces of the IDs consist of the second to last one being a letter that decrements through the alphabet every sixteen packets, and the last space decrementing from letters f to a and then from digits 9 to 0 with every passing packet, and then cycling through again, with each ICMP Echo (ping) request. ✓
- 8. Value in Identification Field: 0x9d7c (40316)

```
Value in TTL Field: 255 ✓
```

```
9 18:48:02.835178

11. The title of the "<u>Fragmented IP Protocol</u>" along with the Flags section displaying the statement "<u>More Fragments</u>" are pieces of information in the IP header that indicates that the datagram has been fragmented. The <u>fragment offset</u> section of the datagram is valued at <u>zero</u>, which indicates that this fragment is the first one rather than a latter one. The datagram is <u>540 bytes</u> long, including the header.
