Positive Experience:

Software Engineering I (CS 361): GitHub Programming Projects

Throughout the entire term, all of our programming assignments and final project were done in a group. I was a part of an initially randomly assigned group with two other people, and honestly, I couldn't have asked for a better group to be in. They were amazing group members and people to work with. There were friendly attitudes throughout the group, no matter how difficult and complex the assignments and project might have been. Our group was truly built off the endless "trust and respect" we had for one another (60). We all understood the situations and difficulties we faced- we conquered them together. Also we all made sure that everyone benefitted from our collaborated work, helped one another out, and never blamed one another or left anyone behind to struggle or face foreseen consequences later on. We all grew stronger as group as the term went on with every assignment and final project that we completed as a team.

Negative Experience:

Writing in Business (WR 214): Unit 3

Being in such a group wasn't a complete negative experience, just possibly the least positive group experiences that I have been a part of so far. Defining each of our "team member responsibilities" wasn't made very clear as the unit went on (47). There was a lack of communication that we could've greatly benefited on as each assignment and project was due throughout the unit. If we improved on our group's communication, we could've been more productive and avoided the issues we did face, and also provide not only the decent level of work we did turn in, but the best quality of work we could've produced.
